N.C	This pin is left unconnected.

Connecting Input Signals

Connect the input signals to a device which can be current-driven, such as a switch or transistor output device. The connection requires an external power supply to feed currents. The board inputs the ON/OFF state of the current-driven device as a digital value.

Input Circuit

The input circuits of interface blocks of the PIO-32/32L(PCI)H is illustrated in Figure. The signal inputs are isolated by opto-couplers (ready to accept current sinking output signals). The board therefore requires an external power supply to drive the inputs. The power requirement for each input pin is about 5.1 mA at 24 VDC (about 2.6 mA at 12 VDC).

Connecting a Switch

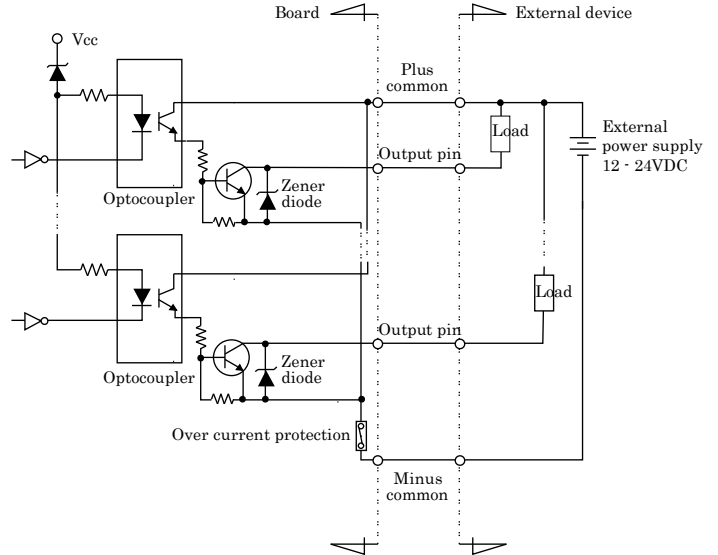

When the switch is ON, the corresponding bit contains 1.
When the switch is OFF, by contrast, the bit contains 0.

Output Circuit

Connect the output signals to a current-driven controlled device such as a relay or LED. The connection requires an external power supply to feed currents. The board controls turning on/off the current-driven controlled device using a digital value.

Output Circuit

The output circuits of interface blocks of the PIO-32/32L(PCI)H is illustrated in Figure. The signal output section is an opto-coupler isolated, open-collector output (current sink type). Driving the output section requires an external power supply. The rated output current per channel is 100 mA at maximum. The output section can also be connected to a TTL level input as it uses a low-saturated transistor for output. The residual voltage (low-level voltage) between the collector and emitter with the output on is 0.5 V or less at an output current within 50 mA or at most 1.0 V at an output current within 100 mA. To protect against surge voltage, a Zener diode is connected to the output transistor. Also, an overcurrent protection circuit is attached to a unit of eight output channels.

CAUTION

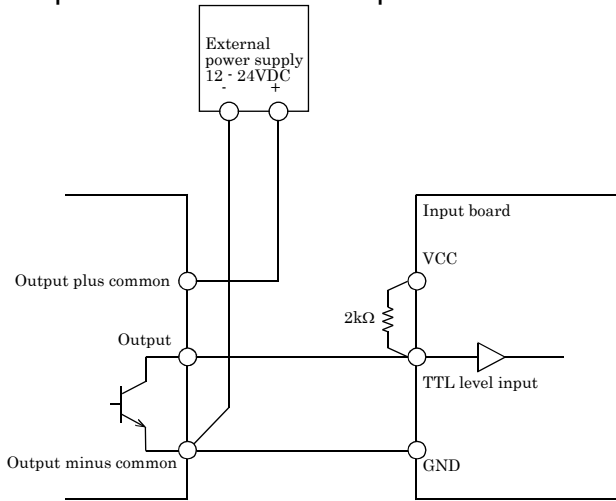

When the PC is turned on, all output are reset to OFF.

Connection to the LED

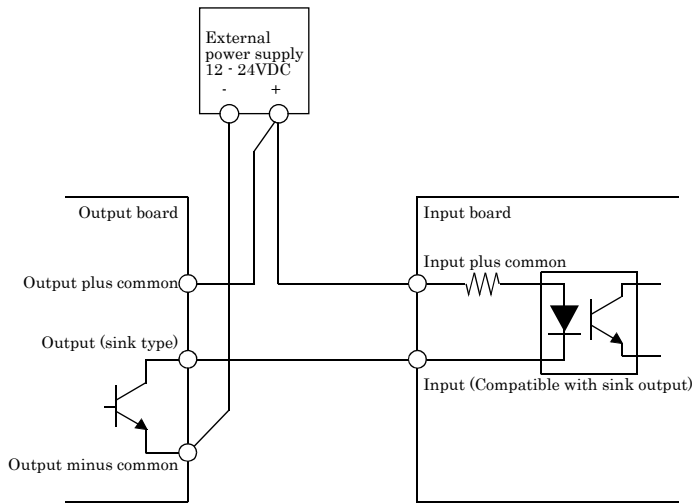

When "1" is output to a relevant bit, the corresponding LED comes on.
When "0" is output to the bit, in contrast, the LED goes out.

The following example shows a connection between a sink type output (output board) and a sink output support input (input board). Refer to this connection example when you connect such boards to each other.

Differences between the PIO-32/32L(PCI)H and PIO-32/32L(PCI)

The PIO-32/32L(PCI)H is connector-pin compatible with the conventional PIO-32/32L(PCI) but has the following differences from it:

- (1) Different in the number of input signals available to interrupt requests
 - PIO-32/32L(PCI)H : All of 32 channels
 - PIO-32/32L(PCI) : 4 channels
- (2) Different in the expression to calculate the digital filter time (n: setting value)
 - PIO-32/32L(PCI)H : $2n / (8 \times 106)$
 - PIO-32/32L(PCI) : $2n / (16 \times 106)$
- (3) Protective elements provided for outputs
 - PIO-32/32L(PCI)H : Surge protector: Zener diode
 - PIO-32/32L(PCI) : Nothing
- (4) Different in interrupt level resource allocation
 - PIO-32/32L(PCI)H : Automatically allocates on interrupt level.
 - PIO-32/32L(PCI) : Uses a jumper switch to select whether to allocate interrupt levels.
